- The Mindful Brain
## Temperament and Attachment

### Temperament
- An inborn feature of the child (not only genetic)
- Inborn predisposition of the nervous system
- May have lifelong impact that is influenced by experience – especially with caregivers

### Attachment
- The relationship of the child to the caregiver over time
- Research has shown attachment shapes the developing mind
- Attachment impacts self-regulatory circuits
Chess and Thomas’ Nine Aspects of Parental Report of Temperament: Matching

- **Activity Level** (the motor activity)
- **Rhythmicity** (regularity of functions)
- **Approach** (positive response to new stimuli vs. withdrawal)
- **Adaptability** (ease with which responses are modified)
- **Threshold of Responsiveness** (sensitivity level)
- **Intensity of Reaction** (the general energy level of a response)
- **Quality of Mood** (the intensity and nature of emotional responsiveness)
- **Distractability** (responsiveness to extraneous stimuli altering ongoing behavior)
- **Attention span/persistence** (vigilance in attending to task)
## Attachment I: Relationships in Research (ISS: Infant Strange Situation) Studies

Attachment II: Adults Making Sense of Their Lives (Adult Attachment Interview)

Adult Narrative
- F – Free/Secure
- Dis – Dismissing
- E – Entangled, Preoccupied
- U – Unresolved

Trauma or Grief

Child Attachment
- Secure
- Avoidant
- Anxious
- Disorganized
Attachment III: What do the different types of adult stories sound like?

- **Free** - flexible, coherent, *self-reflective*, balanced perspective
- **Dismissing** - incoherent, inflexible, minimize emotional significance, insist on *lack of recall*
- **Entangled** - preoccupation with past *intrudes* on present, intense idealization
- **Unresolved** - *disorganization*, disorientation around issues of grief or trauma
The Brain is a Social Organ

- The function of the brain is to engage with other people, other brains, in the shaping of its development over time and in shaping its activity in the present.
- Mirror Neurons and the capacity to develop empathy and insight = MINDSIGHT.
More on the Social Brain

- Our brains are extremely social. Areas involved in self-regulation overlap with those involved in interpersonal communication and plasticity.

- How one brain interacts with another has important effects on how the brain functions: Social interactions are one of the most powerful forms of experience that help shape how the brain gives rise to the mind.
The Brain in the Palm of Your Hand
The Brain: A Systems View of Brain Anatomy, Function, and The Mind
Neurobiology in the Palm of Your Hand

- A Readily Available, Three-Dimensional Model of the Brain
- Structure and Function
- Neural Integration
- Self-Regulation
Brain Development: Inspire to Rewire

Repeated Activation Creates, Strengthens and Maintains Connections:

- “Neurons which FIRE together WIRE together”

Development across the lifespan: plasticity, neural pathways and self-organization.

A simple idea: “Human connections shape neural connections”
Secure Attachment Promotes:

- Flexible self-regulation
- Prosocial behavior
- Empathy
- Positive sense of emotional well-being and self-esteem
- Coherent life-story
The Central Role of the Integrating Middle Prefrontal Cortex:

- Bodily Regulation
- Attuned Communication
- Emotion Regulation
- Response Flexibility
- Fear Modulation
- Insight
- Empathy
- Morality
- Intuition
The Low Road

- Temporarily Disengaging the Middle Aspect of the Prefrontal Cortex dissolves the nine functions of the middle PFC including Body Regulation, Attunement, Emotional Balance, Response Flexibility, Fear Modulation, Insight, Empathy, Morality, and Intuition
Secure Attachment and Compassionate Connections

Mindsight enables us to meet life’s challenges with more flexibility and joy in our internal and interpersonal worlds.

We are ultimately connected to each other as part of a larger whole.
